

Building Soil Health with Composted Soil Conditioner

- **Build a living soil - rich in soil organic matter, carbon, and microbial activity**
- Improve nutrient retention and nutrient use efficiency
- Supply nutrients in slow-release form
- Improve soil water holding capacity
- Reduce soil bulk density and compaction to improve water infiltration and root penetration
- Control plant disease.

Composted Soil Conditioner is available for delivery and spreading in the Tamworth Region. The product is composted and matured over a minimum of 12 weeks and is monitored to ensure destruction of pathogens and weed seeds, and to build more stable forms of carbon. Each batch is tested to ensure regulatory compliance. A laboratory analysis of the product is available on request.

Composted Soil Conditioner is a product requiring bulk spreading in a similar way to Ag Lime or Gypsum and works well when co-applied with these products. Guidance for application:

- Plan to apply a minimum of 2.5 tonne/ha/year or at higher rates every 2 to 4 years
- To maximise benefit, incorporate into soil or apply where the soil surface is protected by crop cover
- Reduce synthetic fertiliser application rates to account for nutrient supply and efficiency
- Additional guidance is available on request.

Indicative prices for locations within 50km of Tamworth are:

- Compost delivered and spread \$82/tonne + GST
- Compost including delivery (self-spread) \$70/tonne + GST
- Blends with Ag Lime and/or manure are available on request
- Prices are for a minimum order of 40 tonnes and are subject to access and paddock conditions.
